Related technology The tools that are normally used to create BIM (Building Information Modeling) projects can be used in AutoCAD. LISP (Language Integrated Scripting) for AutoCAD, formerly known as WinCAD LISP, allows users to create macros, functions and scripts for their own use. In contrast to the ObjectARX, which is available for free on the AutoCAD App Store, WinCAD LISP is a commercial product which is required for AutoCAD. LISP-based macros, like those of ObjectARX, have a similar syntax, being written in pure LISP. There is also a set of utilities for manipulating LISP files, called lisptools. AutoLISP, AutoCAD's built-in version of LISP, is a preprocessor like C++ or Java, which allows users to include and use functions, macros and scripts written in LISP. AutoCAD Architecture and AutoCAD Electrical are bundled together in the same application and use the same shared memory database; these are essentially variations of the same product. AutoCAD Civil 3D is a separate application, based on the same C++ class library, and uses a different set of objects. The Civil 3D database is a variant of the DWG format. The data fields are numbered differently. Some of the scripts in AutoCAD Architecture can also be used in AutoCAD. Along with versions of AutoCAD for Windows, macOS and Linux, some versions of AutoCAD also include a version of AutoCAD LT, a successor to AutoCAD for the Macintosh. AutoCAD LT offers limited functionality, and all functions not available in AutoCAD are not available. The .NET scripting framework (Add-On Architect), also based on ObjectARX, also works with AutoCAD Architecture and AutoCAD Electrical; this is not possible in AutoCAD LT. Features Superstructure AutoCAD can be used to produce 2D and 3D structural models. A list of common AutoCAD commands for modeling construction projects can be found in the command Reference for AutoCAD. The structure information is stored in a "superstructure" database. The user can enter the drawings into the database. The standard database file is a DGN file (drafting) with two extensions: an ARX file for wall openings and an AMX file ca3bfb1094

Q: scrape content from website using HtmlUnit I'm trying to scrape content from a website that has a list and each item in the list has a. When I click on the link of the item, it goes to a page. I have a bunch of pages like that. How can I scrape them using HtmlUnit? A: It's very simple: `HtmlPage page = webClient.getPage("");` After you have the HTML page object, you can read the contents of the tag as follows: `List list = page.getByXPath("//ul[@class='external']/li");` for(int i=0; i<list.size(); i++) { `String href = list.get(i).getHtmlText();` `HtmlPage page = webClient.getPage(href);` `String content = page.getHtmlText();` `System.out.println("Page: " + href + " Content: " + content);` } `}` `}` // BaseViewController.h // UserGuide // // Created by Pedro Lúcio on 6/23/14. // Copyright (c) 2014 Pedro Lúcio. While many people may use the stock iOS 6 interface to perform some basic tasks, it doesn't look like Apple is going to change that for its new operating system, according to reports coming out of the company's developer conference. On Wednesday, at Apple's Worldwide Developers Conference, the company introduced a new file system it is calling "flat"
