You've heard that a recent study suggests that people who suffer from cannabis use disorder have a greater chance of being diagnosed with depression or anxiety, and maybe it has something to do with cannabis. But the truth is that cannabis dependence is just as likely to lead to the development of an addiction to other drugs. And this hasn't been noticed in many studies. The study Pharmacologist David Nutt, a former head of the British government's Advisory Council on the Misuse of Drugs, was studying whether cannabis use was related to depression and anxiety. He and several colleagues in the United Kingdom examined the drug patterns of 10,000 people who reported current depression or anxiety. They found that the people with a cannabis dependence also had greater likelihood of depression or anxiety disorders. The study was published in the American Journal of Psychiatry in March. It was summarized in a recent Forbes article. The conclusions Nutt says that "the ability of cannabis to cause such widespread problems is among the most troubling aspect of this study." For example, he says, "the people who were most likely to score in the highest range of dependence had nearly twice the risk of being diagnosed with either depression or anxiety." Of course, there are people who develop a habit of using cannabis, but who don't have a cannabis use disorder. Because the study couldn't distinguish between that, and the possibility that a cannabis use disorder is associated with depression or anxiety, it's unclear how much of the association can be explained by "normal use" of cannabis. The study also can't explain why people who are more likely to have an addiction to alcohol or other drugs are more
